Homework 2

For this homework you will create a github repo, set up github pages, clone the repo to your computer as an R project, create a .qmd file, and push those changes back to github to create a webpage! You'll submit the link to your github pages site (the one that looks like a nice website).

If you were unable to get RStudio and github connected, try to set up a meeting with Dr. Post or Gabby to get that figured out! For now, it is ok to use the web interface but you want to move past that method quickly!

Step 1

- Head to github and create a new repo.
 - Be sure to make the repo puble and do not choose a .gitignore

Step 2

- Create a new R project from version control (as we did in the notes/videos) that clones this repository locally.
 - Recall you can click on the green button on the github.com repo website to copy the repo link.
 - A .gitignore file may be created in this process. That isn't a worry!

Step 3

- Create a new .qmd document that outputs to HTML. You can give this a title about programming in Base R. Save the file in the main repo folder.
- In this document, answer the questions below. Use BaseR manipulations for all problems below to obtain full credit.

Task 1: Basic Vector practice

Suppose we have data from a medical experiment on blood pressure. We have the following pre-treatment values for subjects 1 through 20:

130, 128, 116, 124, 133, 134, 118, 126, 114, 127, 141, 138, 128, 140, 137, 131, 120, 128, 139, 135

after treatment, the subjects were measured again (subjects 1 through 20 match)

• 114, 98, 113, 99, 107, 116, 113, 111, 119, 117, 101, 119, 130, 122, 106, 106, 124, 102, 117, 113

1. Create two vectors. One vector corresponding to the pre measurements and one to the post measurements.

```
set.seed(10)
pre_trt_bp <- round(rnorm(20, mean = 135, sd = 10))
post_trt_bp <- round(rnorm(20, mean = 125, sd = 10))</pre>
```

2. Assign names to the vector elements using the paste() function. Note that names() can be overwritten by a character vector. To quickly create the names, try running the code

```
paste("Subject", 1:20, sep = "_")

## [1] "Subject_1" "Subject_2" "Subject_3" "Subject_4" "Subject_5"

## [6] "Subject_6" "Subject_7" "Subject_8" "Subject_9" "Subject_10"

## [11] "Subject_11" "Subject_12" "Subject_13" "Subject_14" "Subject_15"

## [16] "Subject_16" "Subject_17" "Subject_18" "Subject_19" "Subject_20"
```

Create the same names for each vector's elements.

```
subjects <- paste("Subject", 1:20, sep = "_")
names(pre_trt_bp) <- names(post_trt_bp) <- subjects</pre>
```

3. Calculate the change in blood pressure for each patient by subtracting post-treatment measurements from pre-treatment measurements. Recall that R does math elementwise! Save this calculation as a new object in R (also a vector).

```
diff_bp <- pre_trt_bp - post_trt_bp
diff_bp</pre>
```

```
## Subject_1 Subject_2 Subject_3 Subject_4 Subject_5 Subject_6 Subject_7
## 16 30 3 25 26 18 5
## Subject_8 Subject_9 Subject_10 Subject_11 Subject_12 Subject_13 Subject_14
## 15 -5 10 40 19 -2 18
## Subject_15 Subject_16 Subject_17 Subject_18 Subject_19 Subject_20
## 31 25 -4 26 22 22
```

4. Calculate the average decrease in blood pressure across all patients.

```
mean(diff_bp)
```

```
## [1] 17
```

5. Determine which patients experienced a decrease in blood pressure after treatment (a positive change). Use the which() function to just return the indices (and names) associated with this type of change.

```
which(diff_bp > 0)
```

```
##
   Subject_1 Subject_2 Subject_3 Subject_4 Subject_5 Subject_6 Subject_7
##
         1
                 2
                         3
                                  4 5
##
   Subject_8 Subject_10 Subject_11 Subject_12 Subject_14 Subject_15 Subject_16
                               12
                                        14
##
         8
             10
                       11
## Subject_18 Subject_19 Subject_20
##
                 19
        18
```

6. Subset the vector of differences to only return those that have a positive change.

```
diff_bp[diff_bp > 0]
                                      Subject_4
                                                 Subject_5
##
    Subject_1 Subject_2 Subject_3
                                                             Subject 6
                                                                         Subject 7
##
           16
                       30
                                   3
                                              25
                                                         26
                                                                     18
##
    Subject_8 Subject_10 Subject_11 Subject_12 Subject_14 Subject_15 Subject_16
##
           15
                      10
                                              19
                                                         18
## Subject_18 Subject_19 Subject_20
##
           26
                       22
```

7. Calculate the average decrease in blood pressure for those where the blood pressure decreased (positive change).

```
mean(diff_bp[diff_bp > 0])
## [1] 20.64706
```

Task 2: Basic Data Frame practice

Continue the previous example.

1. Create a data frame object with four columns corresponding to your data above: patient, pre_bp, post_bp, and diff_bp

2. Return only rows where the diff_bp column is negative. (Use [or learn about the subset() function if you'd like. If you use [, don't reference the original vector from the first part, access the column of the data frame when looking at making a comparison.)

```
bp_df[bp_df$diff_bp < 0, ]</pre>
##
                  patient pre_bp post_bp diff_bp
## Subject 9
                Subject 9
                               119
                                       124
                                                 -5
## Subject_13 Subject_13
                               133
                                       135
                                                 -2
## Subject_17 Subject_17
                               125
                                       129
                                                 -4
```

3. Add a new column to the data frame corresponding to TRUE if the post_bp is less than 120. Recall you can use \$ to access a column. If you reference a column that doesn't exist, and save a vector (of appropriate length in it), that vector becomes a column of your data frame! Similar to the previous question, don't reference the original vector from the first part, access the column of the data frame when looking at making a comparison.

```
bp_df$normal <- bp_df$post_bp < 120</pre>
```

4. Finally, print the data frame out nicely in your final document by modifying the code below appropriately.

```
knitr::kable(bp_df)
```

Task 3: List practice

Continue the previous example. Suppose we now also have data from another experiment where the 'treatment' was actually a placebo.

We have the following pre-treatment values for subjects 1 through 10 (different set of subjects):

• 138, 135, 147, 117, 152, 134, 114, 121, 131, 130

after treatment, the subjects were measured again (subjects 1 through 10 match)

- 105, 136, 123, 130, 134, 143, 135, 139, 120, 124
- 1. Create a new data frame with this data in it that is similar to the data frame from task 2 (including the new column).

- 2. Now create and store a list with two elements:
 - 1st element named treatment and contains the first data frame you created.
 - 2nd element named placebo and contains the second data frame you created.

3. Access the first list element using three different types of syntax.

bp_list\$treatment

```
##
                 patient pre_bp post_bp diff_bp normal
## Subject_1
               Subject_1
                             135
                                     119
                                               16
                                                    TRUE
## Subject_2
               Subject_2
                             133
                                     103
                                               30
                                                    TRUE
## Subject_3
               Subject_3
                             121
                                     118
                                                3
                                                    TRUE
## Subject_4
               Subject_4
                             129
                                     104
                                               25
                                                    TRUE
## Subject_5
               Subject_5
                             138
                                               26
                                                    TRUE
                                     112
## Subject_6
               Subject_6
                             139
                                     121
                                               18
                                                   FALSE
## Subject_7
               Subject_7
                             123
                                                5
                                                    TRUE
                                     118
## Subject 8
               Subject_8
                                               15
                                                    TRUE
                             131
                                     116
## Subject_9
               Subject_9
                             119
                                     124
                                               -5 FALSE
## Subject_10 Subject_10
                             132
                                     122
                                               10
                                                  FALSE
## Subject_11 Subject_11
                             146
                                     106
                                               40
                                                    TRUE
## Subject 12 Subject 12
                                               19 FALSE
                             143
                                     124
## Subject_13 Subject_13
                                               -2 FALSE
                             133
                                     135
```

```
## Subject_14 Subject_14
                             145
                                     127
                                               18 FALSE

                                                    TRUE
```

bp_list[1] #returns a list with one element in it

\$treatment ## patient pre_bp post_bp diff_bp normal ## Subject_1 Subject_1 135 119 16 TRUE TRUE ## Subject_2 Subject_2 133 103 30 ## Subject_3 Subject_3 121 118 3 TRUE ## Subject_4 Subject_4 129 104 25 TRUE ## Subject_5 Subject_5 138 112 26 TRUE **FALSE** ## Subject_6 Subject_6 139 121 18 ## Subject_7 123 118 5 TRUE Subject_7 ## Subject_8 Subject_8 131 116 15 TRUE -5 FALSE ## Subject_9 Subject_9 119 124 ## Subject_10 Subject_10 132 122 10 FALSE 146 106 40 TRUE ## Subject_11 Subject_11 ## Subject_12 Subject_12 143 19 FALSE 124 ## Subject_13 Subject_13 133 135 -2 FALSE ## Subject_14 Subject_14 145 127 18 FALSE ## Subject_15 Subject_15 142 111 31 TRUE 136 TRUE ## Subject_16 Subject_16 111 ## Subject_17 Subject_17 129 -4 FALSE 125

```
## Subject_18 Subject_18 133 107 26 TRUE
## Subject_19 Subject_19 144 122 22 FALSE
## Subject_20 Subject_20 140 118 22 TRUE
```

4. In one line, access the placebo data frame, pre_bp column.

```
bp_list$placebo$pre_bp
## [1] 138 135 147 117 152 134 114 121 131 130
```

Task 4: Control Flow Practice

Continue the previous example.

1. Suppose we want to characterize the post-treatment (or placebo) blood pressure measurement as optimal (≤ 120), borderline ($120 < bp \leq 130$), and high (> 130). First, create a new column in each data frame from above called status. You can do this via

```
your_df$status <- character(20) #or 10 depending on number of observations
```

Note: You want to do this additional column to the data frames that are stored in your list (R doesn't do referencing to the original object).

```
bp_list$treatment$status <- character(20)
bp_list$placebo$status <- character(10)</pre>
```

- 2. For the non-placebo data frame (within the list), create a for loop and use if/then/else logic to create the status column's values.
- 3. Repeat for the placebo data frame (within the list).

```
#many ways to do this
#one way
for (i in 1:nrow(bp list$treatment)){
  if (bp_list$treatment$post_bp[i] <= 120){</pre>
bp_list$treatment$status[i] <- "optimal"</pre>
  } else if (bp list$treatment$post bp[i] <= 130){</pre>
bp_list$treatment$status[i] <- "borderline"</pre>
  } else {
bp_list$treatment$status[i] <- "high"</pre>
  }
}
#second way
counter <- 1
for (i in bp_list$placebo$post_bp){
  if (i <= 120){
bp_list$placebo$status[counter] <- "optimal"</pre>
counter <- counter + 1</pre>
  } else if (i <= 130){</pre>
bp list$placebo$status[counter] <- "borderline"</pre>
counter <- counter + 1</pre>
```

```
} else {
bp_list$placebo$status[counter] <- "high"
counter <- counter + 1
}
}</pre>
```

Task 5: Function Writing

Continue the previous example. Suppose you would eventually have many datasets in the form of the two above. You want to write a function to do some things for you quickly.

1. Write a function that

- takes in a list with two data frames in it (a treatment and a placebo data frame) as an argument. Give no default value.
- takes in an R function (that would find a summary of a numeric column) with the default value being set to "mean" (notice this is a quoted string).
- Finds the statistic of interest (as defined by the user input) for the pre, post, and diff columns of both data frames.
 - Use my_fun <- get(stat) within the function to get the function from the quoted string.
- These six values should then be returned as a named list with meaningful names this is a somewhat challenging part!
 - I'm going to let you consider what to do but you might create a vector of names that is created dynamically based on the statistic passed, create a vector with the actual statistic values, and then assign names() to your vector. Then return that (an atomic vector with names can be returned instead of a list).
- Finally, apply your function to you list of data frames from previous. Use it without specifying your statistic, with specifying your statistic as "var", "sd", "min", and "max".

```
calculate_stat <- function(list_of_df, stat = "mean"){</pre>
  vals <- c("pre", "post", "diff")</pre>
  types <- c("placebo", "treatment")</pre>
  my names <- character(6)
  counter <- 1
  for (i in types){
for(j in vals){
      my_names[counter] <- paste(i, j, stat, sep = "_")</pre>
      counter <- counter + 1</pre>
}
  }
  fun_stat <- get(stat)</pre>
  to_return <- c(fun_stat(list_of_df$placebo$pre_bp),</pre>
              fun_stat(list_of_df$placebo$post_bp),
              fun_stat(list_of_df$placebo$diff_bp),
              fun_stat(list_of_df$treatment$pre_bp),
              fun_stat(list_of_df$treatment$post_bp),
              fun_stat(list_of_df$treatment$diff_bp))
  names(to_return) <- my_names</pre>
  return(to_return)
calculate_stat(bp_list)
```

```
##

```

• You can render the document to check things are looking good. Make sure that all code chunks show (and are evaluated). **Use headings to separate the sections.** Write text before each code chunk explaining what you are trying to do. Use markdown where appropriate (to create lists, bold things, etc.).

Step 4

(The subsequent steps are the same steps from homework 1 - more detail is given there.)

In your repo folder (locally), create a file called _quarto.yml. Open this file (perhaps in RStudio or a text editor) and place the following in the file (spacing is important!):

```
project:
```

type: website
output-dir: docs

Step 5

Now create a file called .nojekyll in your project repo. This file doesn't need to have anything in it! You just need that file there (it may be a hidden file after you create it. Github should still track it.)

Step 6

Open the terminal in RStudio and run the following code:

quarto render

Step 7

Push all changes up to your repo! You can do this via menus or the command line (or via the github web interface).

Step 8

Head to your github repo page. Go to settings, choose pages, and under "Branch" choose 'main' and change the folder to /docs. Then hit save!

Step 9

Wait about 2 minutes... Head back to your main github repo page. You'll now see a 'Deployments' section on the bottom right.

Click on that. Hopefully, after a minute you see a green check and something that says your site is ready!

Click on that and you should see a nicely rendered website! Copy the link to that site and that is what you'll turn in for this assignment!
